Date: May 13, 2013

Subject: Traffic Study for Proposed Hotel Project at 1130 S. Hope Street, City of Los Angeles
[KOA Job Number JB31082]

KOA Corporation has prepared this traffic study to 1) evaluate the proposed hotel operations associated with traffic and parking, 2) analyze the feasibility to accommodate truck delivery and pedestrian activities on the north alley that is located adjacent to the proposed hotel, and 3) determine the adequacy of on-street parking supply in front of the hotel to accommodate hotel guest pick-up/drop-off demand and vehicular queuing.

The proposed project is located on the east side of S. Hope Street between 11th and 12th Streets, which is in the South Park district within Downtown Los Angeles, California. The site address is 1130 S. Hope Street.

PROJECT DESCRIPTION

The proposed project involves the renovation of a vacant 3-story apartment building into a 10-story, boutique-style hotel. The hotel would have 44 guest rooms as well as amenities such as approximately 983 square feet of restaurant space on the ground floor, 2,225 square feet of bar/lounge area on the lower level, and 740 square feet of conference/meeting room space on the third floor. Most of the existing building interior will be demolished. However, the design preserves the complete shell of the previous building and builds within, around and upon it. The north alley, which is the northern boundary of the hotel building, would be 20 feet wide.

The main entrance of the hotel building will front Hope Street. This entrance would provide access to an open courtyard which leads to the lobby. The hotel building would also have a public counter fronting the north alley just east of Hope Street. The counter will be used by the public to order "take-out" food from the hotel restaurant. The north alley would be used to accommodate a pedestrian use space.

In lieu of providing on-site parking spaces, the hotel will provide parking via leased spaces in nearby public parking facilities located within 1,500 feet from the site. The location(s) of the leased spaces are unknown at this time, but the spaces will be provided prior to hotel completion and occupancy.

Loading and unloading for hotel guests will be accommodated on-street in front of the site. Valet parking service will be provided for the guests. It is envisioned that a guest who is arriving by car would park in front of the site, unload their luggage, if any, and the valet staff would drive their vehicle to the off-site parking facility. A guest who

is leaving by car would inform the hotel staff of their departure, wait for valet staff to drive their vehicle to the hotel for their departure. It should be noted that there is a fire hydrant located in front of the site on Hope Street, and street parking in front of the site is prohibited. As part of the project, it is proposed that the fire hydrant be relocated in order to provide for approximately 2 to 3 loading/unloading spaces. There are also four on-street passenger loading parking spaces on the east side of Hope Street between 11th and 12th Streets that could be used by hotel guests. Two of the spaces are located south of 11th Street and are within approximately 220 feet from the site. The remaining two spaces are located just south of the south alley, which bounds the south side of the hotel building. These spaces are located within approximately 100 feet from the site.

Truck deliveries would occur on the north alley adjacent to the hotel. Delivery trucks would include single-unit trucks and large vans; Deliveries via semi-trailer trucks are not expected to occur. It is estimated that there would be approximately six truck deliveries on a typical day. Deliveries would occur in the early morning and before 10 a.m. Although deliveries are anticipated to occur during the early morning period, there could be a few deliveries that may occur after 10 a.m. due to unforeseen circumstances (e.g. delivery of goods not available until later in the day).

Figure 1 provides the conceptual site layout. Figure 2 shows the passenger loading and truck delivery locations.

EXISTING CONDITIONS

Adjacent Land Uses

Adjacent land uses include commercial/residential mixed-use buildings (LUMA at 1100 S. Hope Street, ELEVEN at 1111 S. Grand Avenue, and EVO at 1155 S. Grand Avenue) that are located to the north, northeast and east of the site. To the south of the site is a one-story commercial building. An alley (south alley), which is an easement, separates the proposed hotel building and the commercial building.

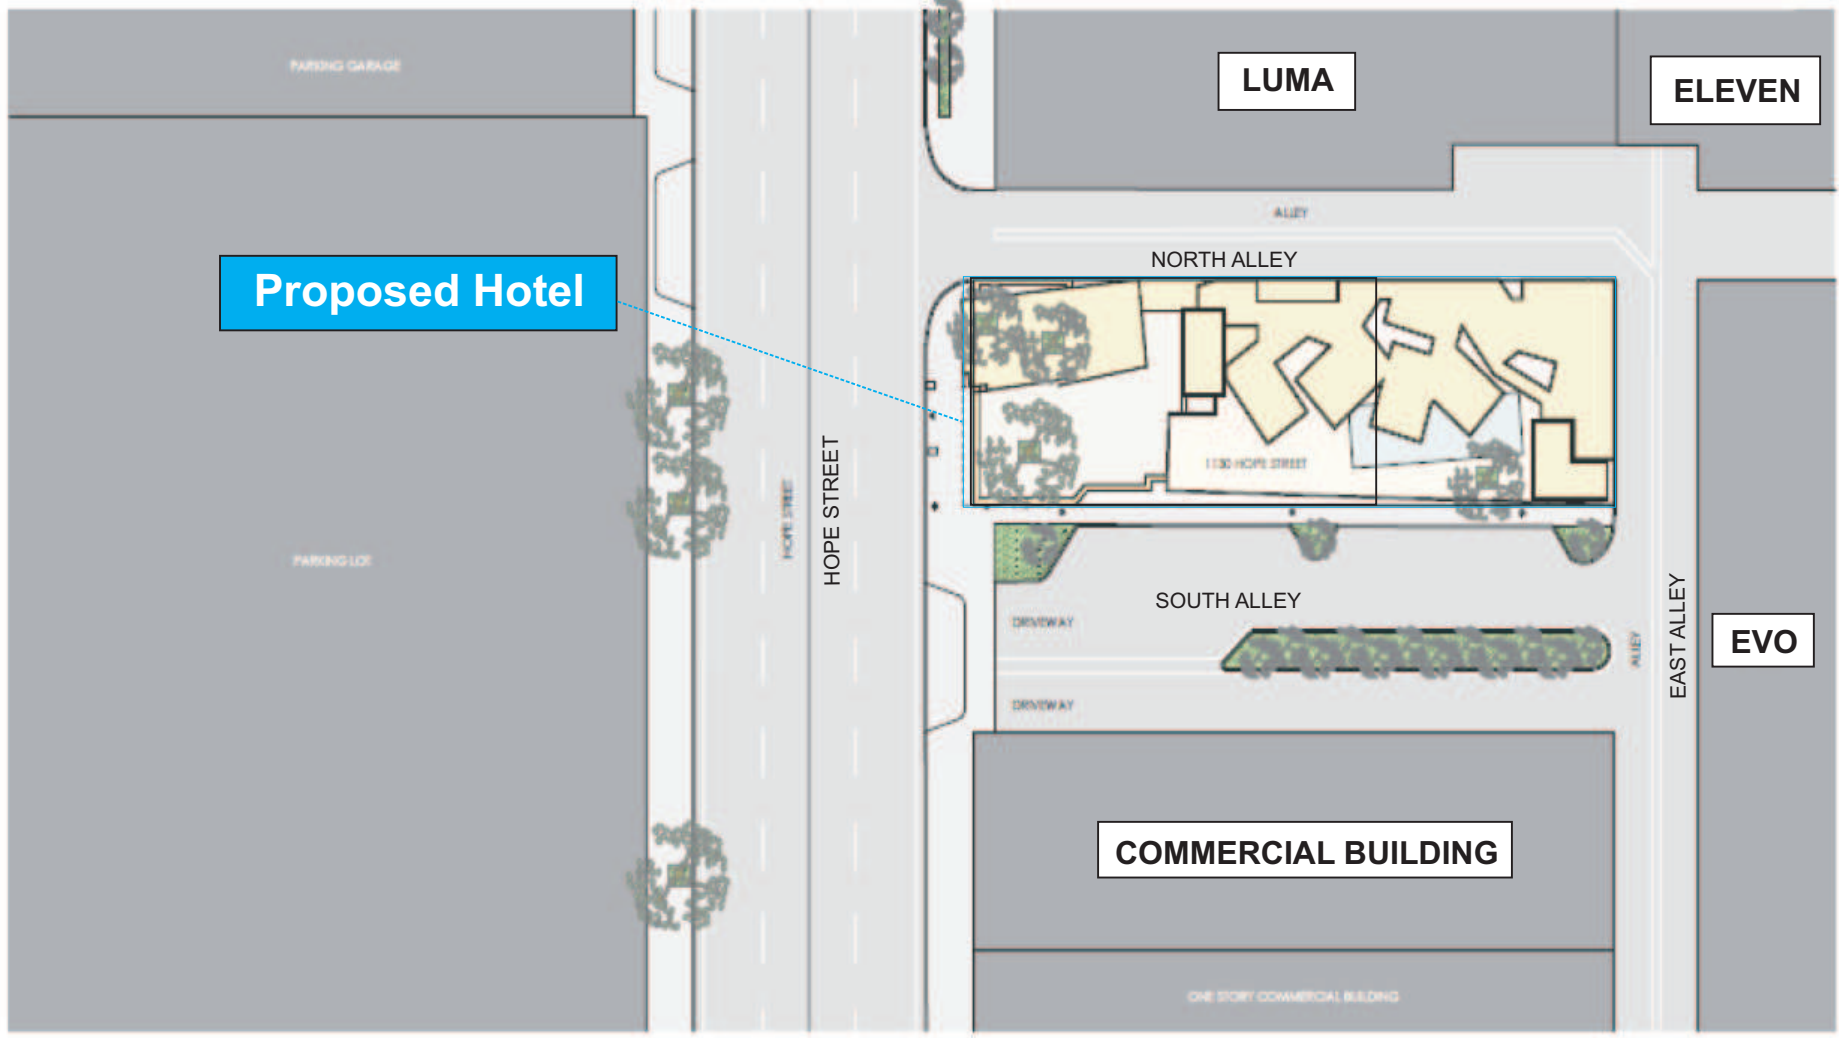

The LUMA and ELEVEN buildings provide primary gated access via 11th Street, with secondary gated access from an alley (east alley) that is located to the east of and adjacent to the proposed hotel building. The east alley also provides gated access for the EVO building. The existing traffic activities including vehicle, pedestrian and bicycle trips on the north, east and south alleys are primarily due to access for these buildings via the east alley.

Traffic Volumes on Alleys

Traffic counts were conducted to determine the amount of traffic activity on the following alley segments:

1. North alley between Hope Street and the east alley
2. East alley north of the south alley
3. East alley south of the south alley
4. South alley between Hope Street and the east alley

The counts were collected for four days from Thursday, May 2nd through Sunday, May 5th, 2013 between 4:00 a.m. and 10 p.m. Vehicle, pedestrian and bicycle volumes were included in the counts. Table I summarizes the traffic volumes on the alley segments. The count data sheets are provided in Attachment A.

* The AM and PM peak hours are the four highest consecutive 15-minute volumes from 7 a.m. to 10 a.m. and from 4 p.m. to 7 p.m., respectively.

As shown in Table, I, vehicle activity on the north alley is low, with an average of 13 vehicle trips during the a.m. peak hour (less than 1 trip every 4 minutes) and 22 vehicle trips during the p.m. peak hour (about 1 trip every 3 minutes). Pedestrian activity on average is also low on the north alley, with 9 pedestrians during the AM peak hour (about 1 pedestrian every 7 minutes) and 20 pedestrians during the PM peak hour (about 1 pedestrian every 3 minutes). Bicycle trips are nominal on the north alley, with two or fewer trips during both the a.m. and p.m. peak hours.

Traffic activity on the south and east alleys is also low. On the south alley, there were 34 to 43 vehicle trips, 10 to 12 pedestrian trips and no bicycle trips during the a.m. and p.m. peak hours. On the east alley, there were 21 to 32 vehicle trips, 9 to 17 pedestrian trips, and no bicycle trips during the a.m. and p.m. peak hours.

A review of the traffic counts on the north alley was also conducted for the period between 4 a.m. and 10 a.m., which is when truck deliveries would occur. As shown in Table 2, there were on average a maximum of 9.5 vehicle trips per hour, a maximum of 6.8 pedestrian trips per hour, and a maximum of 1.8 bicycle trips per hour. This is approximately one vehicle trip per 6 minutes, one pedestrian trip per 9 minutes, and one bicycle trip per 33 minutes. The counts show that traffic activity is very low during the early morning period.

Notes: EB = eastbound; WB = westbound

Based on the low counts, traffic operations on the alleys are adequate and no traffic conflicts exist.

On-Street Parking (Passenger Loading)

Parking demand counts were also conducted for the four on-street passenger loading spaces located on the east side of Hope Street between 11th and 12th Streets. The counts were collected for four days from Thursday, May 2nd through Sunday, May 5th, 2013 between 4 a.m. and 10 p.m. The count data sheets are provided in Attachment A.

As shown in Table 3, each of the four spaces was unoccupied at least approximately half of the time on Thursday, Friday and Saturday during the 4 a.m. to 10 a.m. count period. On Sunday, the two spaces located south of 11th Street were occupied during most of the count period. The high occupancy is due to a few vehicles that were parked in these spaces for a long duration of time. The two spaces located south of the south alley were unoccupied about half the time on Sunday. On average, there was at least one on-street passenger loading space that was not occupied during half of the count period.

Table 3 – On-Street Passenger Loading Space Parking Demand

Location	Parking Space	% of Total Time Unoccupied (4:00 a.m. to 10:00 p.m.)				
		Thursday	Friday	Saturday	Sunday	Average
East side of Hope St south of 11 th St	1	77%	69%	48%	2%	49%
	2	87%	72%	51%	1%	53%
East side of Hope St south of South Alley	1	55%	60%	65%	45%	56%
	2	66%	61%	67%	53%	62%

EVALUATION OF TRAFFIC OPERATIONS

Truck Deliveries on North Alley

As noted previously, the north alley carries low traffic volumes (an average of less than 10 vehicle trips, 7 pedestrian trips and 2 bicycle trips) during the peak hour between 4 a.m. and 10 a.m. It is estimated that there would be approximately six deliveries per day that would occur between the 4 a.m. and 10 a.m. period. Based on the current traffic volume activity, the north alley would be able to accommodate hotel truck deliveries. In addition, the proposed use of a portion of the north alley as a pedestrian use space by the hotel would not impact traffic operations on the alley.

Hotel Guest Loading and Unloading

The number of trips that would arrive to and depart from the hotel was calculated to determine the demand for loading/unloading spaces. Trip generation for the proposed hotel was estimated based on Institute of Transportation Engineers *Trip Generation Manual*, 9th Edition.

According to ITE Trip Generation, hotels are places of lodging that provide sleeping accommodations and supporting facilities such as restaurants, cocktail lounges, meeting and banquet rooms, limited recreational facilities (e.g. pool) and/or other retail and service shops. Thus, the trip rates for hotel use are inclusive of trips generated by the guest rooms and all hotel amenities. However, the proposed restaurant would also be open to the public. Thus, trip generation for the restaurant use was calculated separately using restaurant trip rates from ITE *Trip Generation*. An internal capture of 50% for the restaurant use was applied, which assumes that about half of the patrons would also be guests of the hotel. In addition, the trip rates are based on surveys of hotels that are located outside central business districts (CBD) in suburban areas where transit usage is generally limited. It should be noted that the project is located in a CBD which typically has a higher percentage of people who use alternative modes of transportation. Thus, a 10% transit trip discount was applied to the hotel use to take into account guests who may use transit rather than drive to the hotel.

Table 4 summarizes the trip generation for the hotel. As shown in this table, the hotel would generate 21 a.m. peak hour trips (13 inbound and 8 outbound) and 26 p.m. peak hour trips (13 inbound and 13 outbound). The trip generation estimate assumes that all guests would utilize valet service. The demand for valet service would be less if some guests self-park their vehicle.

Table 4 – Trip Generation

Land Use	Size	ITE Code	Average Weekday					
			AM Peak Hour			PM Peak Hour		
			In	Out	Total	In	Out	Total
<i>Trip Generation Rates</i>								
Hotel	- room	310	59%	41%	0.53	51%	49%	0.60

Total Trip Generation			13	8	21	13	13	26

Source: Institute of Transportation Engineers (ITE) *Trip Generation*, 9th Edition.

Valet service for arriving guest who drive to the hotel would take a maximum of approximately seven minutes to service one vehicle, assuming it takes one minute for the driver and any passengers to exit their vehicle and unload their luggage, another minute for the valet staff to drive and park the vehicle at the off-site lot, and another five minutes for the valet staff to walk back to the hotel. A valet staff would be able to serve about 8.6 arriving vehicles per hour. This assumes that the off-site parking lot is approximately 1,500 feet from the site. A valet staff would be able to serve more vehicles per hour if the off-site lot is closer than 1,500 feet from the site. For example, if the off-site lot is 750 feet away, then it would take approximately four minutes to serve one vehicle, or about 15 vehicles per hour. A summary of the valet service time calculations is provided below.

Valet service time for one arriving vehicle assuming off-site lot is 1,500 feet from the site

Unload luggage (it is assumed valet staff will assist with luggage, if needed) = 1 min

Drive vehicle to off-site lot = $1,500 \text{ ft} \times (1 / 5,280 \text{ ft}) \times (1 / 25 \text{ mph}) \times (60 \text{ min}) = 0.68 \text{ min}$ or about 1 min

Walk back to hotel = $1,500 \text{ ft} \times (1 / 5 \text{ ft per sec}) \times (1 / 60 \text{ sec}) = 5 \text{ min}$

Approx. total service time = **7 min**

Valet service time for one arriving vehicle assuming off-site lot is 750 feet from the site

Unload luggage (it is assumed valet staff will assist with luggage, if needed) = 1 min

Drive vehicle to off-site lot = $750 \text{ ft} \times (1 / 5,280 \text{ ft}) \times (1 / 25 \text{ mph}) \times (60 \text{ min}) = 0.34 \text{ min}$ or about 0.5 min

Walk back to hotel = $750 \text{ ft} \times (1 / 5 \text{ ft per sec}) \times (1 / 60 \text{ sec}) = 2.5 \text{ min}$

Approx. total service time = **4 min**

Valet service for guest who leaves the hotel would also take a maximum of approximately seven minutes to serve one vehicle assuming the off-site lot is 1,500 feet away. Assuming the lot is closer such as 750 feet away, it would take approximately four minutes to serve one vehicle.

However, if a guest arrives while another guest is waiting to pick up their vehicle, then service time for both vehicles would be a total of approximately five minutes, which assumes the off-site lot is 1,500 feet from the hotel. The valet service time calculations are summarized below.

Valet service time for one arriving and one departing vehicles assuming off-site lot is 1,500 feet from the site

Unload luggage (it is assumed valet staff will assist with luggage, if needed) = 1 min

Drive first vehicle to off-site lot = $1,500 \text{ ft} \times (1 / 5,280 \text{ ft}) \times (1 / 25 \text{ mph}) \times (60 \text{ min}) = 0.68 \text{ min}$ or about 1 min

Locate second vehicle in the off-site lot = 1 min

Drive second vehicle back to hotel = about 1 min

Load luggage and drive away (it is assumed valet staff will assist with luggage, if needed) = 1 min

Approx. total service time = **5 min**

Assuming as a worst case that the off-site lot would be 1,500 feet from the site, three valet staff would be able to service approximately 26 vehicles per hour. If a guest arrive while another guest depart at the same time, or if the off-site lot is less than 1,500 feet away, then the vehicle service rate would be higher than 26 vehicles per hour.

Since the hotel is estimated to generate low number of trips during peak hours (21 vehicle trips during the a.m. peak hour and 26 vehicle trips during the p.m. peak hour), three valet staff would be able to handle the guest loading and unloading demand. Fewer valet staff may be needed if the distance between the off-site lot and the hotel is less than 1,500 feet.

A vehicle that is in the loading/unloading area would typically park for only about a minute before the valet staff or guest drives away with the vehicle. Based on the anticipated peak hour demand, the provision of two to three guest loading spaces would be adequate. The demand is not expected to result in queuing spillover. It should be noted that there are also four on-street loading spaces located on the east side of Hope Street in close proximity to the hotel site. These spaces can also be used as additional loading/unloading capacity, if necessary.

CONCLUSIONS

Based on the low traffic activity that currently exists on the north alley, the addition of six daily truck deliveries by the hotel can be accommodated. The use of the north alley as a pedestrian use space would not impact traffic operations on this alley.

Based on the projected peak hour demand of the hotel and valet service provided at the hotel, the provision of two to three guest loading spaces in front of the hotel would be adequate. No queuing spillover is anticipated to occur.
